

Replication Material and Supplementary Material: Citizenship Regimes and the Politicization of Immigrant Groups

Didier Ruedin, didier.ruedin@wolfson.oxon.org

19 January 2017

This document contains all the analyses reported in the paper (replication material), plus supplementary material. Everything is based on claims in the regular (random) sample, and claims about the country under study. Not included are claims in the additional samples and claims that are not about the country under study.

Ruedin, Didier (2017) Citizenship Regimes and the Politicization of Immigrant Groups, *Austrian Journal of Political Science*, 46(1).

Actor Classifications

Anti-Immigrant Parties

Party	Party ID
<i>Austria</i>	
FPÖ	42420
BZÖ	42710
<i>Belgium</i>	
VB	21914
FN	21710
<i>Ireland</i>	
–	–
<i>Netherlands</i>	
PVV	22722
LPF	22720
<i>Spain</i>	
–	–
<i>Switzerland</i>	
SVP	43810
SD	43710
FP/AP	43951
<i>United Kingdom</i>	
UKIP	51951
BNP	51701

Only anti-immigrant parties with claims in the dataset are included; SVP since 1999, according to Ruedin (2013) Swiss party position on immigration: Ruedin, Didier (2013) Obtaining party positions on immigration in Switzerland: Comparing different methods, *Swiss Political Science Review*, 19(1): 84-105.

Left-Wing Parties

Party	Party ID
<i>Austria</i>	
Grüne	42110
SPÖ	42320
<i>Belgium</i>	
Ecolo	21111
Groen (Agalev)	21112
SP/ SP.A	21221
PS	21322
<i>Ireland</i>	
Green Party	53110
Democratic Left	53221
Labour Party	53320
Sinn Fein	53951
Socialist Party	53999
<i>Netherlands</i>	
GL	22110
SP	22220
PvdA	22320
PvdD	22951
<i>Spain</i>	
IU	33220
PSOE	33320
BNG	33908
<i>Switzerland</i>	
Grüne	43110
SP	43320
FDP	43420
<i>United Kingdom</i>	
Labour Party	51320

    z <- table(posit[gpactor1==ycodes[j] & voiceless ==xcodes[i]]) # cross tab
    # table() does not give zero counts, so I re-create them here:
    z <- cbind(z["-1"],z["-0.5"],z["0"],z["0.5"],z["1"]) # joining, to get empty cells, too
    z[is.na(z)] <- 0         # replace empty cells (NA) with zero
```

```

plot(density(posit[gpactor1==ycodes[j] & voiceless ==xcodes[i]], bw=0.3,
  na.rm=TRUE), axes=FALSE, ylab="", xlab="", main="")
abline(v=interp.median(posit[gpactor1==ycodes[j] & voiceless ==xcodes[i]],
  na.rm=TRUE), lwd=2)
abline(v=0, lty=3)
mtext(paste("N",sum(z), sep="="),1, 0.5) # give N
if(j==1) mtext(xlabels[i],3, 1) # labels in margins, with offset
if(i==1) mtext(ylabels[j],2, .5)
}
}

```

```
# dev.off()
```

Here's an alternative with object evaluation.

```

xlabels <- c("Voiceless", "Other")
xcodes <- c(1, 0)
ylabels <- c("Other Actors", "Civil Society", "Left-Wing", "Anti-Immigrant")
ycodes <- c(0, 1, 2, 3)
len <- length(xlabels)
dwn <- length(ylabels)
par(mfrow = c(4,2)) # 4 by 2 cells, labeling in margins
par(mar=c(2,3,3,2)) # smaller borders
for(j in 1:dwn) { # repeat for each actor

```

```

for(i in 1:len) {      # repeat for each immigrant group
  z <- table(objeval1[gpactor1==ycodes[j] & voiceless ==xcodes[i]]) # cross tab
  # table() does not give zero counts, so I re-create them here:
  z <- cbind(z["-1"],z["0"],z["1"]) # joining, to get empty cells, too
  z[is.na(z)] <- 0 # replace empty cells (NA) with zero
  plot(density(objeval1[gpactor1==ycodes[j] & voiceless ==xcodes[i]],
    bw=0.4, na.rm=TRUE), axes=FALSE, ylab="", xlab="", main="")
    # kernel densities, bw set to smooth out
  abline(v=interp.median(objeval1[gpactor1==ycodes[j] & voiceless ==xcodes[i]],
    na.rm=TRUE), lwd=2)
  abline(v=0, lty=3) # interpolated median; zero line
  mtext(paste("N",sum(z), sep="="),1, 0.5) # give N
  if(j==1) mtext(xlabels[i],3, 1) # labels in margins (only edge), with offset
  if(i==1) mtext(ylabels[j],2, .5) # labels in margins (only edge), smaller offset
}
}

```

Here is an alternative version not in the paper. It uses the alternative definition of CSO specified at the beginning of this document: CSO2 definition includes migrant actors as CSO:

```

xlabels <- c("Voiceless", "Other")
xcodes <- c(1, 0)
ylabels <- c("Other Actors", "Civil Society", "Left-Wing", "Anti-Immigrant")

```

```

ycodes <- c(0, 1, 2, 3)
len <- length(xlabels)
dwn <- length(ylabels)
par(mfrow = c(4,2))           # 4 by 2 cells, labeling in margins
par(mar=c(2,3,3,2))         # smaller borders
for(j in 1:dwn) {           # repeat for each actor
  for(i in 1:len) {         # repeat for each immigrant group
    z <- table(objeval1[gpactor2==ycodes[j] & voiceless ==xcodes[i]]) # cross tab
    # table() does not give zero counts, so I re-create them here:
    z <- cbind(z["-1"],z["0"],z["1"]) # joining, to get empty cells, too
    z[is.na(z)] <- 0 # replace empty cells (NA) with zero
    plot(density(objeval1[gpactor2==ycodes[j] & voiceless ==xcodes[i]], bw=0.4,
      na.rm=TRUE), axes=FALSE, ylab="", xlab="", main="")
    abline(v=interp.median(objeval1[gpactor2==ycodes[j] & voiceless ==xcodes[i]],
      na.rm=TRUE), lwd=2)
    abline(v=0, lty=3)
    mtext(paste("N",sum(z), sep="="),1, 0.5) # give N
    if(j==1) mtext(xlabels[i],3, 1) # labels in margins, with offset
    if(i==1) mtext(ylabels[j],2, .5)
  }
}

```
